Dataset Access - Experimental 5G SSB Jamming Evaluation

This document provides the access link and basic instructions for downloading the experimental RF dataset used in the paper *"Experimental Analysis of Machine Learning Paradigms for SSB Jamming Detection in 5G Networks"*.

Due to GitHub's file size limitations for large binary data, the complete collection of raw complex IQ samples (.c64 files) and preprocessed Welch Power Spectral Density (PSD) representations is hosted on Google Drive. The dataset comprises 10,200 samples acquired from an over-the-air 5G Standalone (SA) testbed operating in band n78, organized into three operational scenarios:

- **Caso A:** Idle Channel (noise floor baseline)
- **Caso B:** Legitimate 5G SA Traffic
- **Caso C:** Selective Jamming Attack targeting the Synchronization Signal Block (SSB)
